

Basic parameters (from TSI)?

Other considerations

- Basic parameter (from TSIs) could be a subset or equal to the intersection between BDC and TSIs Parameters.
- It is clear that not all BDC may effect on TSI parameters, otherwise we can not have Versions ad Variants
- Not all TSI parameters and/or design parameters can be put in B.D.C., otherwise ERATV will become impossible to be managed

Final considerations?

- Better to define B.D.C. as relevant only to define Type, Version Variant. Basic Parameters and B.D.C. may have elements in common
- To not use B.D.C to verify if a new authorization is needed, but only if a new type, variant, version!
