Valenciennes, 16th September 2022

**TAF TSI Compliance Resultc – your Oracle Service Bus (OSB) as the TAF TSI Common Interface (CI)
alternative implementation**

To whom it may concern,

I confirm and certify herewith that the following TAF TSI Common Interface functionality implemented by the company ČD – Informační Systémy, a.s. (Czech Republic), is compliant with the appropriate provisions of the TAF-TSI Regulation 2021/541 and its Technical Documents.

The detailed results of the verification process are concluded as follows:

ČD – Informační Systémy, a.s. has sent to the European Union Agency for Railways on 11 August 2022, for verification, the document “CDIS request for OSB as CI alternative v1.pdf” – see details in Annex.

In addition, ČD Cargo has sent an explanatory note to the European Union Agency for Railways on 15 September 2022 for point g. „ handling the single common access to various databases“ of above document.

ERA has verified the compliance of the document and of the explanatory note for the following points:

- a. message formatting of outgoing messages according to the metadata,
- b. signing and encryption of outgoing messages,
- c. addressing of the outgoing messages,
- d. authenticity verification of the incoming messages,
- e. decryption of incoming messages,
- f. conformity checks of incoming messages according to metadata,
- g. handling the single common access to various databases.

The applicant has demonstrated, that above functions of the OSB are in line with chapter “4.2.11.5. Common Interface” of the TAF/TAP TSI regulation.

For above point g. it should be mentioned additionally, that the OSB is not used for the time being for connection to any database. The only existing TAF TSI database is CRD. The partners of CD IS have access to CRD via web and this fulfils all their needs. The so-called Rolling Stock Reference Database (RSRD) is distributed - with GCU Broker as connecting central point. The partners of CD IS are connected to the so-called GCU Broker in both ways via web services, thus, no need to use the Common Interface necessarily. So there is no functional requirement to use the CI for this purpose. On the other hand, CD IS and its partners plan to use CI for several other use-cases (Train Composition Messages, Train Ready Messages, Train running, Path Request) soon.

Mickael VARGA
European Union Agency for Railways
Railway Systems Unit
Project Officer
Email: mickael.varga@era.europa.eu

Annex:

Request for Certification of the Oracle Service Bus as the Common Interface alternative implementation

We, ČD-Informační systémy, a.s. are IT provider for our sister company ČD Cargo, a.s (CDC). and as well for České dráhy, a.s (CD) as a parent company. They entrusted us to implement the TAF Common Interface for them using the existing Oracle Service Bus (so not using the Common Interface software from RNE).

One of their data exchange partners (Správa železnic, SZ, Czech IM) requests certification that this CI implementation fulfils the TAF CI requirements. Therefore we issue this request to EUAR and we ask you to kindly evaluate our arguments and issue an TAF CI compliance certificate.

Our implementation uses standard functions and features of the Oracle Service Bus (OSB), which is used for (almost) all internal and external communications of CDC and CD. This system was configured to act as the TAF CI and it was successfully tested to Exchange TAF messages with the (RNE) CI of Správa železnic. To prove and evident correct functioning, sending of Train Composition Messages was implemented from system PRIS of CDC to system COMPOST of SŽ (via OSB-CI at CDC and RNE-CI at SŽ).

1 EUAR requirements

The requester submits to ERA elements or screen shots demonstrating that your Common Interface is able to handle:

- a. *message formatting of outgoing messages according to the metadata,*
- b. *signing and encryption of outgoing messages,*
- c. *addressing of the outgoing messages,*
- d. *authenticity verification of the incoming messages,*
- e. *decryption of incoming messages,*
- f. *conformity checks of incoming messages according to metadata,*
- g. *handling the single common access to various databases.*

Your CI should be able to be configured to exchange TAF compliant messages with your partners / databases according to the specifications in the Technical Document “ TAF TSI — Annex A.5: Figures and Sequence Diagrams of the TAF TSI messages”.

Please indicate which TAF TSI functions are supported by your CI. Please send for these functions the messages / datasets from your legacy system and the corresponding TAF compliant messages which have been generated by your CI. Please give us some information about the IT solution you use for this CI and the linked IT Systems within ČD.

The other TAF Technical Document “TAF TSI - ANNEX D.2: APPENDIX E - COMMON INTERFACE” gives you further requirements about CI2CI communication too.

Please indicate us which EU funding you have received to realise this project. If this is not the case please indicate that you have not received EU funding.

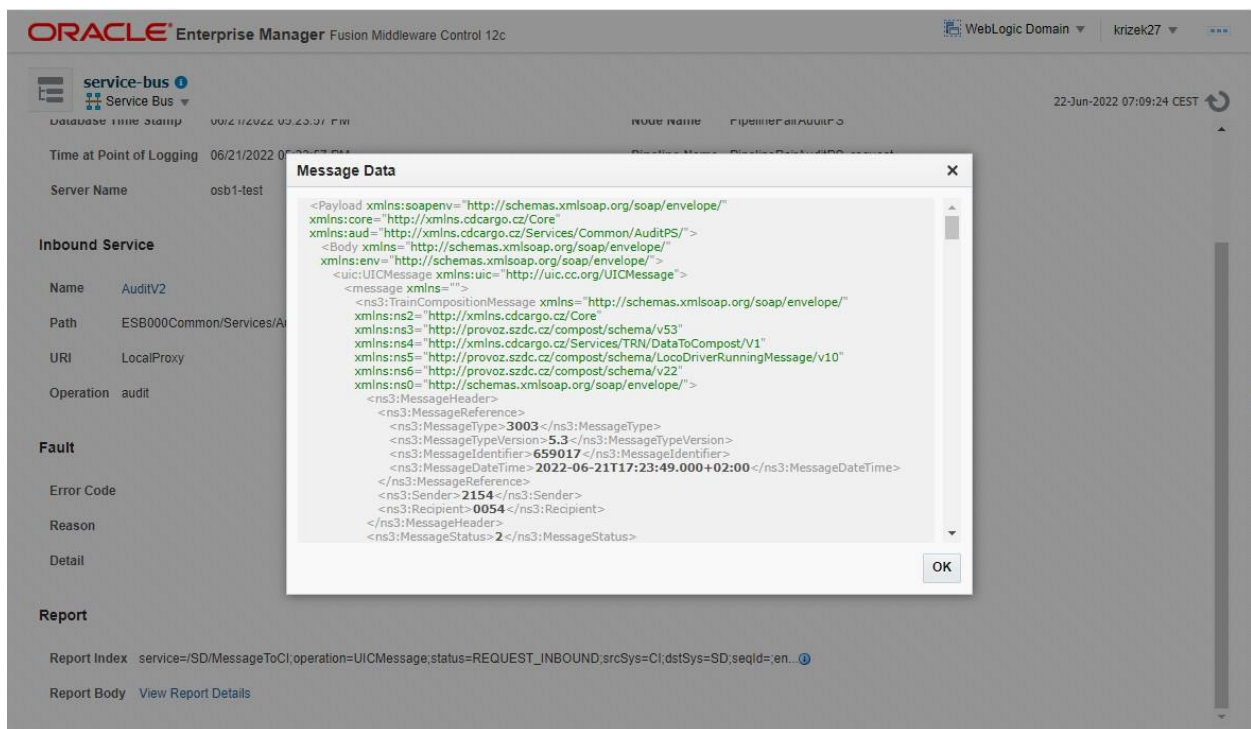

2 Fulfilment of the requirements

a. Message formatting of outgoing messages according to the metadata

Source information system of ČD Cargo – PRIS (Production Information System) generates Train Composition messages based on the TAF standard and same time fulfils the validation requirements defined on the side of the Common Interface. So created messages are natively generated in source system in valid format, as requested by the TAF TCM xsd schema.

Message TO CI

Request (example)

b. Signing and encryption of outgoing messages

Certificate

According to the document „era_technical_document_taf_d_2_appendix_e.pdf“ are both encryption and authentication optional features. Since the communication between CDC and SŽ is performed only in shared intranet, it is accepted and agreed between CDC and SŽ to exchange messages with out these features.

Anyhow, for future purposes (eventual move to Internet) and communication with other partners, CD Cargo, a.s., as well as ČD a.s., concluded CCS Agreement with RNE and purchased and obtained the X.509 security certificate (for non-RNE CI implementation).

Secured communication (using https) will be tested.

It is not currently required by ČD Cargo, a.s., or ČD a.s.

c. Addressing of the outgoing messages

We have recieved needed URL from SŽ for transmission of the Train Compostion messages, which we set into the OSB.

d. Authenticity verification of the incoming messages

For the purpose of communication and possible setup of signature verification are in OSB imported keys into standardized keystore, it means root certificate. From there is the key used by OSB when communicating with Common Interface – through encrypted https channel.

3 Information about our environment

TAF TSI functions supported, exchange of TAF compliant messages

Our OSB-Common Interface is able to transmit TAF compliant messages.

As first TAF function implemented, it supports the Train Preparation function.

It was configured to send TAF Train Composition and Train Ready messages to Správa železnic (SŽ), the Czech IM and to receive confirmation messages from SŽ (both message receipts and processing results messages).

Examples of the TAF Train Composition and Train Ready messages are attached to this Request.

These messages are generated by the source application PRIS as TAF messages so the CI does not need to make any translation of format.

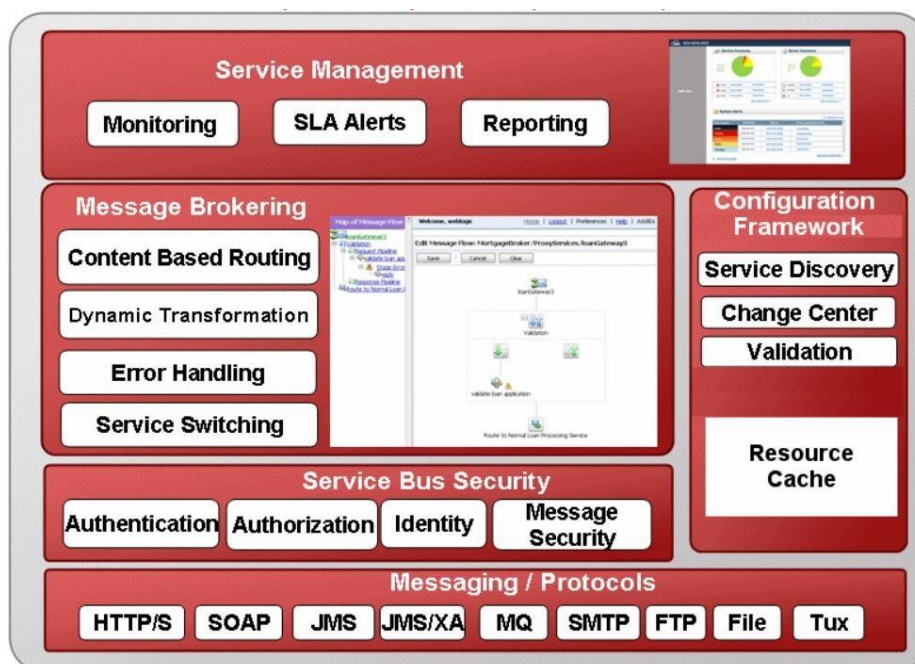

PRIS is the main production system of CDC, where all transported wagons are registered and all train consists are captured.

OSB description

Both ČDC and ČD uses the Oracle service bus (OSB) for communication between its own systems. Both ČDC and ČD also use OSB to communicate with other companies' systems. ČDC and ČD currently operate dozens of integrations on this platform.

OSB is an enterprise integration platform that provides a number of functionalities in the field of Service management, Security, Message brokering, many types of messages and protocols. The functionalities required in a. - g. Are described in the documentation for the specified url.

https://docs.oracle.com/cd/E14571_01/doc.1111/e15020/architecture_overview.htm#OSBCA140

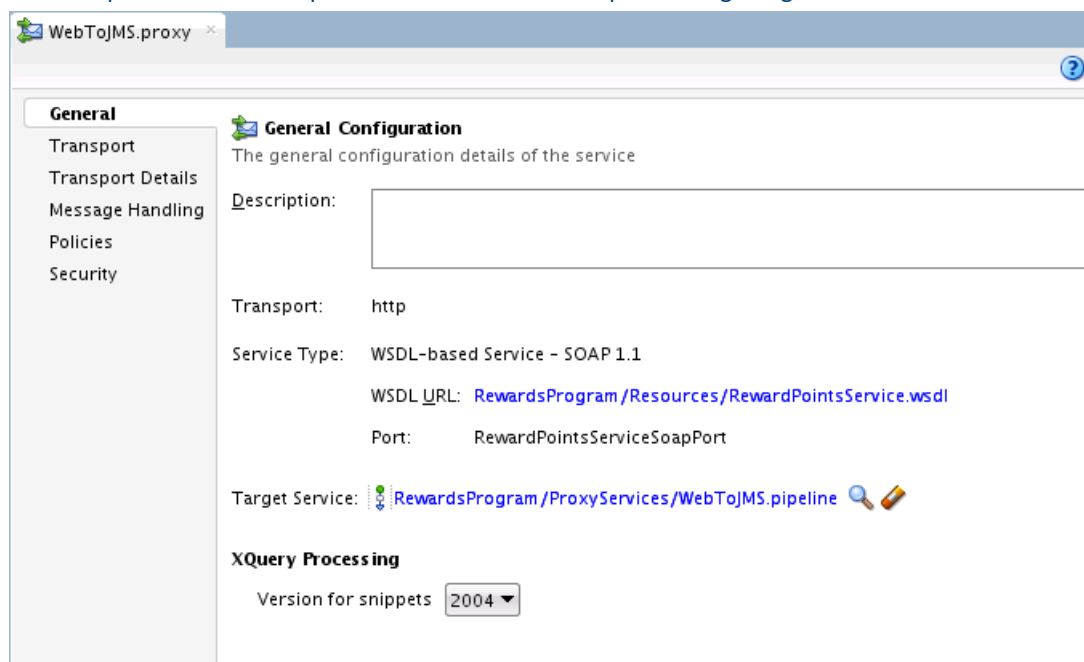

Picture 1 Oracle service bus architecture

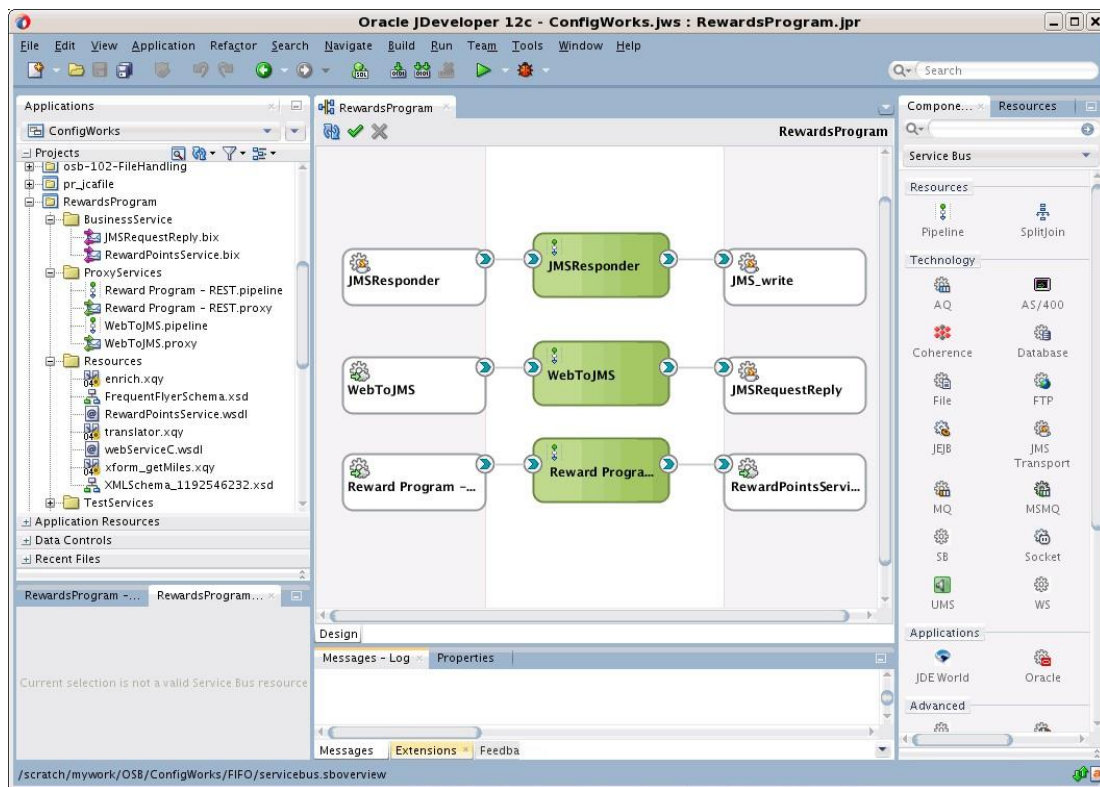

All integrations (including TAF messages) are implemented in the Configuration Framework, which is part of the OSB.

The OSB integration platform is in principle intended for the implementation of communication between business services as well as between different communication platforms.

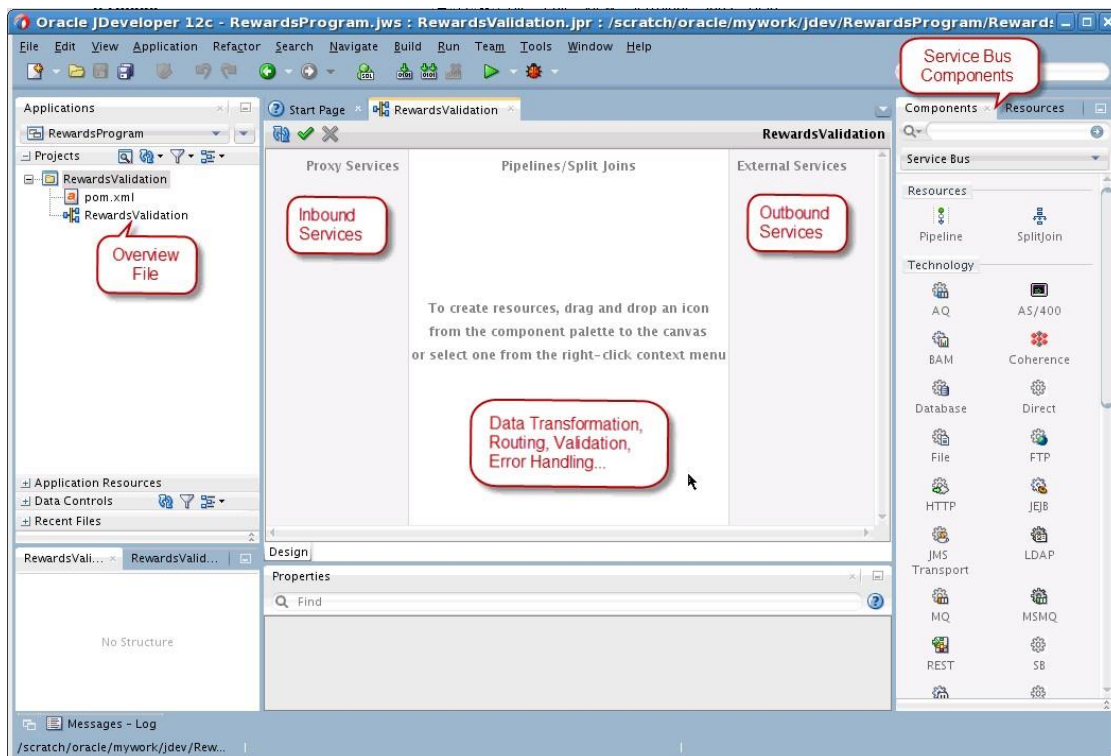

Below are some printscreen development environments for implementing integrations.

Picture 2 Proxy Service Definition Editor in JDeveloper

Picture 3 Oracle Service Bus in JDeveloper

Picture 4 Service Bus Overview Editor

ČD-Informační systémy already operates several OSB instances within the holding. In ČD cargo, TAF already uses messages integrated via OSB for communication between its own systems or for communication with systems of Infrastructure Manager (IM). As an example, we enclose the TAF Train composition message and Train ready message.

EU Funding used

EU funding (through Czech state Ministry of Transport funding program „Operational Programme Transport, Interoperability in rail transport, part Implementation of telematics subsystem – TSI telematic applications in freight transport“) was used in 2014 for implementation of the TAF functions within ČD Cargo. ČD a.s. did not use any funds for their OSB.
