Compliance Results – CEF Grant Agreement INEA/CEF/TRAN/M2018/1784160

To whom it may concern,

I confirm and certify herewith that according to Sub-activities 1.6 and 5.1 of the CEF Grant Agreement INEA/CEF/TRAN/M2018/1784160 the following functionalities have been implemented by ERMEWA SA:

Details of the Action:

Name of the Action:	Telematics Solutions for Safety & Maintenance Improvements in Digital Railfreight Transport - SaMiR
No. of the Action:	2018-EU-TM-0084-S
No. of the Grant Agreement:	INEA/CEF/TRAN/M2018/1784160
Duration of the Action:	01/11/2018 - 31/12/2021
Verified Activity:	Activity 1.6 M2M interface between KB and ERM ¹ Activity 5.1 Automatic wagons list
Verified Milestones:	6: M2M interface between KB and ERM 18: Development and testing of automatic wagons list

Table 1 Action details

¹ KB - Knorr Bremse, ERM - ERMEWA

The detailed results of the verification process are concluded as follows:

Sub-activity 1.6: M2M interface between KB and ERM

The sub-activity includes:

- definition and development of the communication interface between KB and ERM
- implementation and test of first customized applications.

Output: M2M interface between KB and ERM.

Main parameters to be checked: Safe and stable communication interface between KB and ERM.

ERM (IT department) is the leader of the sub-activity; KB supports in the sub-activity implementation.

The expected results from the implementation of Activity 1 are the development of:

- New brake control valve bracket with an interface for all pressures
 - *the beneficiary has provided the Excel file “Wagons.xlsx”, with the wagons which are all fully equipped (list of 82 Shimms four-axle wagons with fixed cradles and removable roof with their unique 12-digit numbers). See Annex 1.*
- New extension, including pressure sensors and a central HUB
 - *the beneficiary has provided the Excel file “Wagons.xlsx”, with the wagons which are all fully equipped (list of 82 Shimms four-axle wagons with fixed cradles and removable roof with their unique 12-digit numbers). See Annex 1.*
- KB CFCB unit with sensors including wireless connection attached
 - *the beneficiary has provided the Excel file “Wagons.xlsx”, with the wagons which are all fully equipped (list of 82 Shimms four-axle wagons with fixed cradles and removable roof with their unique 12-digit numbers). See Annex 1.*
- Tablet application as internet hub connecting mesh network and IT backend
 - *the beneficiary has provided description from the tablet application user interface called “COMMANDER”. See also Annex 2. The beneficiary in this document states some technical and financial deviations.*
- IT backend with database, platform application and specific customized applications for ERM use cases
 - *The beneficiary has provided some Website Screenshots of this IT back end which can be seen in Annex 3. On top of that high level application use cases have been also provided. See Annex 4. The use cases with a green mark in the excel sheet can be monitored by the system, red ones could not be monitored because of the type of data gathered or the way it*

is gathered. In particular, the alert system can support most of these use cases. See attached a screenshot of the alert setup page – Annex 5.

The beneficiary also informed in writing that the brake tests took place outside Berlin (Wustermark, Elstal station of HVLE.)

To demonstrate a linkage to a database the beneficiary has provided some wagon event / positioning structured datasets exported from the database. See Annex 6.

- M2M interface between KB and ERM

➤ *Evidence of applied Machine2Machine interface messages have been provided by the beneficiary. See Annex 7. The messages are compliant with the ITSS Standard Specification “ITSS Interface IF1 (Telematics Application – Customer System) Version 1.2 final”².*

- All applications can be used as tablet applications at the same time

➤ *See findings above.*

Sub-activity 5.1: Automatic wagons list

The sub-activity includes:

- specification of a concept for an automated process for the creation of the wagon list
- implementation and pre-test of the concept
- evaluation of the pre-tests and refinement of the concept based on the test results.

The leader of the sub-activity leader is KB; ERM supports and reviews progress and the results of this sub-activity.

Expected Results of Activity 5:

- capability to create automatically the list of wagons contained from a train
- additional ability to define precisely the sequence and orientation of the wagons (reliable automation leading to decreased errors and improved safety).

➤ *TrainCompositionMessage in TAF TSI compliant format has not been provided by the applicant, due to technical and financial deviations. This activity has some deviations resulting to manual process to input to the application, see “Milestone 18.docx”, Annex 2.*

² https://tis.ag/download/itss_standard_specification_interface1_v1-2_final-pdf/

The beneficiary will report about the achievement of the milestones of Activity 5 to the TAF TSI implementation reporting tool hosted at <http://taf-jsg.info>.

The beneficiary will liaise with the European Union Agency for Railways about the technical details and timing for this report.

- *The beneficiary has liaised on 02.05.2022 with the TAF Joint Sector Group implementation monitoring responsible person.*

Making the railway system
work better for society.

Annex 2 – Milestone 18 report document

2.3.1. Activity 5 - Automatic wagons list (consist of the train)

Objective:

- a. “completing the measures related to improvement of safety of train operation. Sensors equipped on wagons could be also used for the pre-departure checks performed by the railway undertakers. Pre-departure checks consist in checking the integrity of the brake performance of the train and each single wagon of the train. Objective is to use the sensors to do this check and make the data available to the train driver.”

Expected results:

- A. “capability to automatically create the list of wagons contained from a train - **Deviation**
- B. additional benefit would to be able to precisely define the sequence and orientation of the wagons (reliable automation leading to decreased errors and improved safety).” – **Deviation**

Technical fulfilment: 100%

Financial fulfilment of activity: 80.9%

2.3.1.1. Milestone 18 (Sub-Activity 5.1) - Automatic wagons list (consist of the train)

Objective:

- b. “specification of a concept for an automated process for the creation of the wagon list
- c. implementation and pre-test of the concept
- d. evaluation of the pre-tests and refinement of the concept based on the test results”

Description:

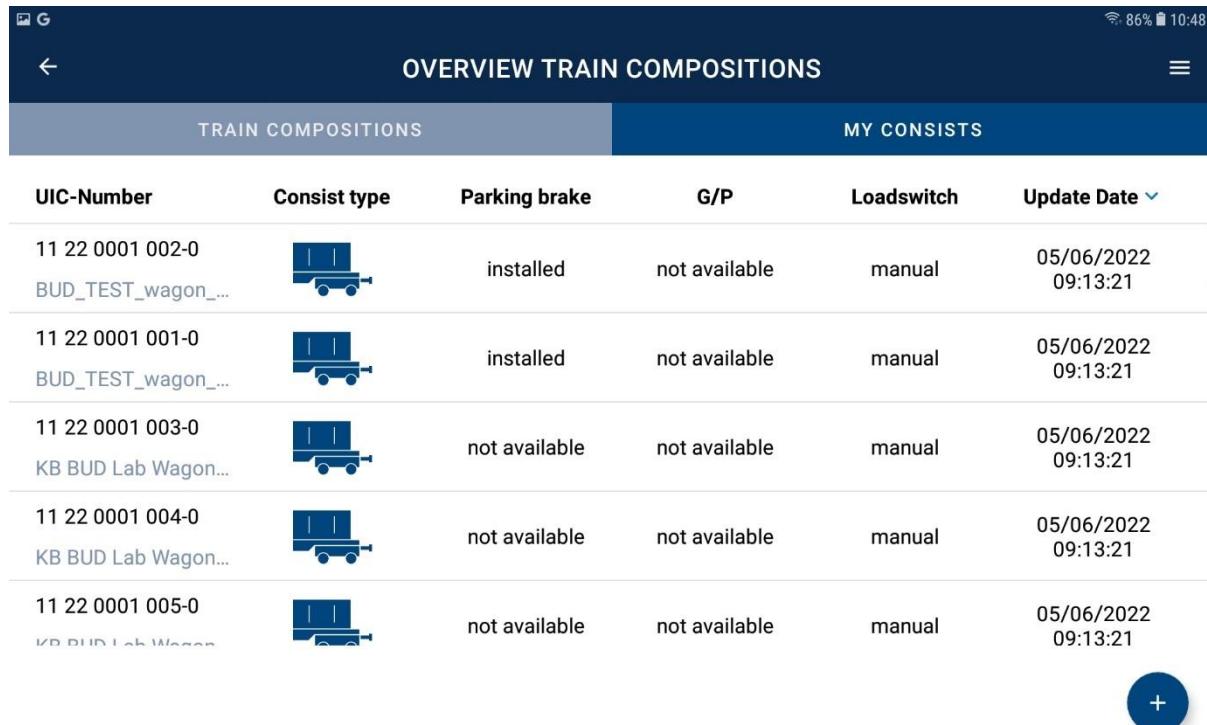

As an extension of Section 2.3.2.4. – “Development of a first implementation of automatic brake test in freight train” to further provide time saving measures for the first / last mile processes of rail freight transport, automation of the wagon list creation process was identified (*objective b*).

Technical Achievements:

A native tablet application with the functionality below was developed (*output A,B*):

Function Train Composition (manual process, input to the Application) (see Figure 33)

- Pool of available consists for preselecting the wagons for a specific train composition
- Adding additional consists with its configuration
- Definition of wagon list with wagon order and wagon number
- Train number and driving direction

The screenshot shows a mobile application titled "OVERVIEW TRAIN COMPOSITIONS". The interface includes a header bar with icons for signal strength, battery level (86%), and time (10:48). Below the header is a navigation bar with a back arrow and a menu icon. The main content area has two tabs: "TRAIN COMPOSITIONS" (selected) and "MY CONSISTS". The "TRAIN COMPOSITIONS" tab displays a table with the following columns: UIC-Number, Consist type, Parking brake, G/P, Loadswitch, and Update Date. The table lists five entries, each with a small icon of a wagon and a link to "BUD_TEST_wagon...". The last entry has a "KB BUD Lab Wagon..." prefix. The "Update Date" column shows "05/06/2022 09:13:21" for all entries. A blue circular button with a plus sign is located at the bottom right of the table.

UIC-Number	Consist type	Parking brake	G/P	Loadswitch	Update Date
11 22 0001 002-0 BUD_TEST_wagon...		installed	not available	manual	05/06/2022 09:13:21
11 22 0001 001-0 BUD_TEST_wagon...		installed	not available	manual	05/06/2022 09:13:21
11 22 0001 003-0 KB BUD Lab Wagon...		not available	not available	manual	05/06/2022 09:13:21
11 22 0001 004-0 KB BUD Lab Wagon...		not available	not available	manual	05/06/2022 09:13:21
11 22 0001 005-0 KB BUD Lab Wagon...		not available	not available	manual	05/06/2022 09:13:21

1. Figure - Screenshot taken from the Train Composition page

Function Train Preparation (manual process, input to the Application) (see Figure 30)

Based on the wagon list, the operator must add information from the train preparation process, like:

- *G/P lever status*
- *Wagon Brake System active or deactivated*
- *Wagon Parking Brake applied/released*
- *Digital Freight Car system available on the specific wagon (installed, not installed, defective)*

Function Automated Brake Test - Guide the operating personal through the brake test procedures (see Figure 31)

List of information and results

- *Wagon order*
- *Wagon number*
- *Service brake status (applied/released, undefined, error, disabled)*
- *Parking brake status (applied/released, undefined, error, not available)*
- *G/P Lever status (G, P, undefined, error)*
- *Result of Brake Test incl. Timestamp (successful, partly failed, failed, undefined)*

7. Figure - Main menu

8. Figure - Live demonstration of the brake test application (2022-05-03)

Technical fulfilment: 100%

Technical deviations:

Field testing was shifted outside the project timeline to 2022 Q2 and was performed on 2022-05-03 (see Figure 36)

Financial deviations:

Due to late fulfilment, till 2021-12-31 an estimated 62 000 EUR were not spent (app development, integration, field testing, etc.).

...

2.3.2.4. Milestone 10 (Sub-Activity 2.4) - Development of a first implementation of automatic brake test in freight train

Objective:

- h. "development of concept for an automatic brake test based on the defined communication infrastructure in Activity 1*
- i. first implementation of the automatic brake test."*

Description:

Automatic Brake Test is one of the main driving forces of the industry as it provides the most benefit for rail freight transport's first mile – last mile problem, that the preparation and post activities takes up 2/3rd of the effort of a transport. To provide the first solution the Brake Test Assistant (BTA) feature set was developed. The first implementation should have minimal features but should provide solution to most of the problems: reduce walking time by a 600m long train by providing brake statuses of the train on a single screen.

Outputs:

C. "The possibility to automate different, previously defined, activities needed for an Automated Brake Test." – **Fulfilled**

Technical Achievements:

The minimal feature set was narrowed down to be able to provide brake applied and released status changes, recognize device faults, (not connected, other issues) measure and indicate leakage (*objective h*).

The BTA feature was lab tested and field tested on a 50-wagon train in 2021-02 (*objective i*).

The field test included a locomotive to supply air and initiate system wake up, application and release of the brakes. Starting from a system supposedly in 'sleep mode' the locomotive had to drop the brake pipe pressure below emergency braking level. The system acknowledged the event as a wake up and switched to "brake testing mode" having more frequent pressure measurements and instant data forwarding. All brake statuses (service and parking brake) were displayed on a tablet screen (Samsung A6, android, Commander UI running in a web browser) (see Figure 18-19). Once the brake test was simulated to DB Rail 915 procedure description and brake statuses were acknowledged and (intentionally for test purposes) parking brakes left applied were released. Test was redone 3 times.

The brake test with Brake Test Assistant was reduced to roughly 5 minutes (without visual check and documentation). This time includes filling time from the loco and data forwarding through the cloud (around 1:30 minutes). Data forwarding times can be dramatically reduced (to tenth of a second) if using direct link to a future train mesh network.

Technical fulfilment: 100%

Technical deviations:

No problems, delays or errors were experienced.

Financial deviations:

Budget planning and use was sufficed for the current milestone.

Making the railway system
work better for society.

Annex 5 - Screenshot of the alert setup page

The screenshot shows the KNORR-BREMSE MANAGE application interface. The top navigation bar includes links for ALERTS, ZONES, and DEVICES. On the far right, a user profile for Charles-Antoine RIVIERE (Ermewa) is visible. The main content area is titled "Alerts" and displays a list of configured alerts. The table columns are: Alert Name, Severity, Created, Active Violations, and Enabled. Each row contains a set of icons for filtering, viewing details, and deleting the alert.

Alert Name	Severity	Created	Active Violations	Enabled
Peak Shock	Information	28 oct. 2020, 11:30:59	0 Alerts	Enabled
BB thickness 60	Critical	28 oct. 2020, 11:28:25	> 11 Alerts	Enabled
Flat Wheel risk alert	Information	28 oct. 2020, 11:26:31	> 2 Alerts	Disabled
BB thickness bogie-2 below 20mm	Important	3 sept. 2020, 09:04:31	0 Alerts	Enabled
Emergency braking	Information	27 août 2020, 16:40:07	0 Alerts	Enabled
BB thickness bogie-1 below 20mm	Important	27 août 2020, 16:37:08	> 2 Alerts	Enabled
Over 5.000 Km	Information	27 août 2020, 16:34:24	> 69 Alerts	Enabled
Overload	Information	27 août 2020, 16:22:51	0 Alerts	Enabled

Making the railway system
work better for society.

Annex 7 - Applied Machine2Machine interface messages (Milestone 13 report)

Test for interface communication ERMEWA-Knorr

Testing of the interface communication between Knorr-Bremse (KB) and ERMEWA.

Test procedure:

- Creation of a test message with dummy data
- Emission a test messages from KB to ERMEWA at different times (various days and hours)
- Verification of the reception of a message
- Verification of the integrity of a message

Expected results:

- Message is emitted by KB and received by ERMEWA without errors in all tested configurations
- Message received match exactly with the emitted ones in all tested configurations

Creation of test messages

One test message created with dummy data:

```
{  
  "GNSS_Position":  
    {  
      "GNSS_Latitude":52.13584,"GNSS_Longitude":5.225756,"GNSS_Speed_kmph":89,  
      "GNSS_UTCTimestamp":1598441163,"GNSS_Heading_deg":246,"GNSS_Altitude":15,  
      "ITSS_LocationInfo":  
        {  
          "Location_ZIP":"3722JC","Location_City":"De Bilt",  
          "Location_Street":"Paltzerweg","Location_Country":"Netherlands",  
          "Location_UIC_Code":"8400179","Location_GeoZone":"NL"  
        }  
    },  
  "ITSS_TelematicsApplicationID":"knorr","ITSS_TransportDeviceID":"33 87 0692 240-2",  
  "ITSS_TelematicsDeviceID":"KNORR-123456789"  
}
```

Emission of messages

The given message is emitted by Knorr 3 times:

- The 19 of November 2020 at 9 A.M.
- The 19 of November 2020 at 10 A.M.
- The 22 of November 2020 at 3 P.M.

Reception of the message

The given message is received by ERMEWA 3 times:

- The 19 of November 2020 at 9 A.M.:

A screenshot of a Microsoft Bloc-notes window titled "*20201119092750_ITSS_knorr_LastPosition_dlosdfvo.json - Bloc-notes". The window contains the following JSON data:

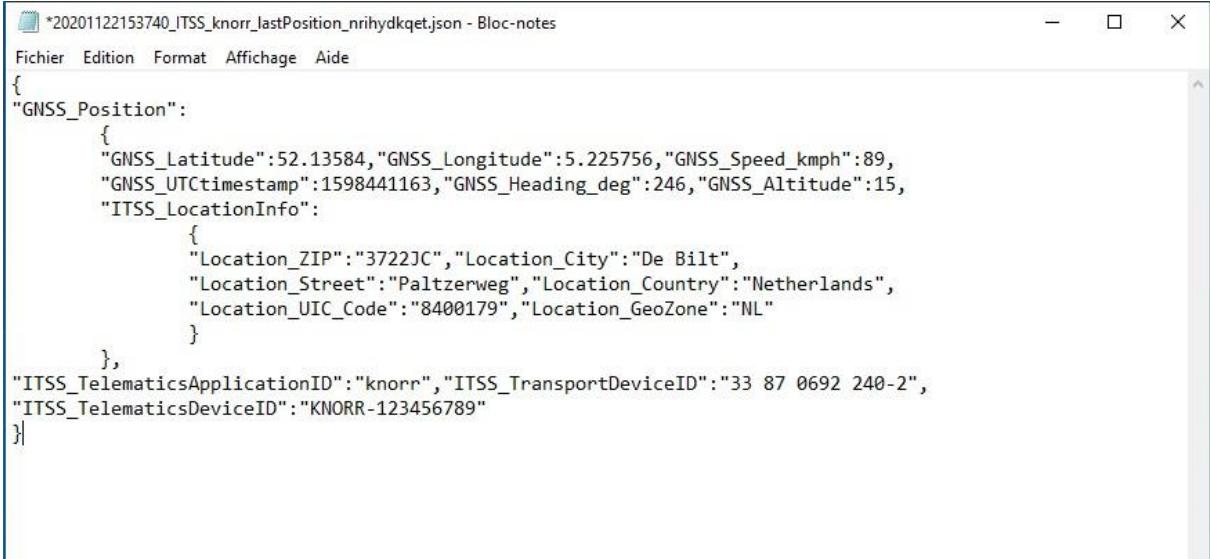

```

  "ITSS_TelematicsDeviceID": "KNORR-123456789"
}
```

The received message match with the emitted one in all 3 communications.

The message is stored by ERMEWA before treatment.

Further test:

Further testing of the data communication in the productive environment will be part of the Activity 3. (See below the report shared during the previous ASR submission)

Sub-activity 3.3:

Test and ramp-up of communication interface development and deployment
Completion date 30/06/2021
Main parameters checked: Reliability of the data received from the field

Reason:

The reliability of the data transmission and its integration in the operational environment need to be verified.

Method:

We compare data from the Commander website (KB backend) and the ERMEWA backend while all equipped wagons are sending messages.

Conclusion:

On the selected group of data, the content of all of them is compliant with the KB backend and there is no gap or missing data.
